## 1 Original Zünd accessories – the benefits

For us, perfection is about fulfilling our customers' wishes. Whatever the application, you will find the right tool in our Accessories Product Catalogue. Our customers' feedback on our 10,000+ installed systems is constantly being incorporated in the initial and further development of our accessories. This is how we ensure that our products constantly remain at the highest level. We always take note of requirements arising from the application of our systems by our customers, and these are constantly incorporated into the range in the form of new or improved products.

As a quality-conscious customer, you benefit from this commitment by being able to make optimum use of your Zünd cutter in terms of productivity and quality.

Rapid availability of high quality replacement parts is a decisive factor in daily operations. Only a manufacturer with a worldwide presence like Zünd can supply original accessories in such little time on a global scale. And if you don't have a catalogue to hand, you can also find all our accessories online at: [www.zund.com](http://www.zund.com).

### 1.1 Warranty limitation

The type of tool used for any given operation can greatly affect cut quality. Forces and vibrations that occur during processing reduce both the life-cycle of tools (EOT, POT, PRT, DRT, URT etc.) and the cut quality.

The combination of Zünd cutters, Zünd tools and Zünd original accessories is the result of many years' intensive development work. This includes continuous input from our customers and their applications. Zünd reserves the right to refuse warranty claims for defects in Zünd cutters caused by the use of non-original Zünd accessories.

## 2 Blades

### 2.1 General information

#### 2.1.1 Benefits at a glance

Zünd offers a broad range of quality blades, specially adapted to your cutting system and suitable for all your needs. This enables you to achieve a consistently high quality standard throughout the entire production process. Zünd blades are developed and manufactured specially by experts to meet market requirements.

#### Zünd blades offer crucial benefits:

- An excellent cutting result
- Low levels of waste/scrap
- Higher capacity utilization and shorter order times thanks to fewer blade changes
- We use only high performance materials
- Our quality remains constant

#### Original Zünd quality

Zünd blades are produced to the highest quality standards. All Zünd blades are recognizable through the Zünd quality seal with which they are engraved.

3 Blade name

## 2.1.2 Blade material

The material the blades are made from plays a major role with regard to the stability and the life expectancy of the blade. Zünd blades are made from carbide or high speed steel. Carbide blades have a significantly higher life expectancy than high speed steel blades, but high speed steel blades are much less susceptible to impacts and vibrations that can cause the tips to break.

**Tip!**

Never touch carbide blades or bring them into contact with hard objects.

## The benefits of Zünd carbide blades:

- Longer life expectancy than high speed steel.
- Greater productivity thanks to fewer blade changes.
- Better cutting quality thanks to the blade's precision finish and very high stability.

Your Zünd service partners will be pleased to help you choose the best blade for your needs.

## 2.1.3 Blade shape and dimensions

Zünd blades are specifically designed and sharpened to handle a wide range of materials. The additional specifications provided for each blade contain a list of the materials for which it can be used.

### Cutting angle

The cutting angle has a major influence on the cutting force. With drag blades, a narrow cutting angle means smaller drag forces.

However, this has the disadvantage of creating a larger overcut.

Drag blades

Oscillating blade – flat

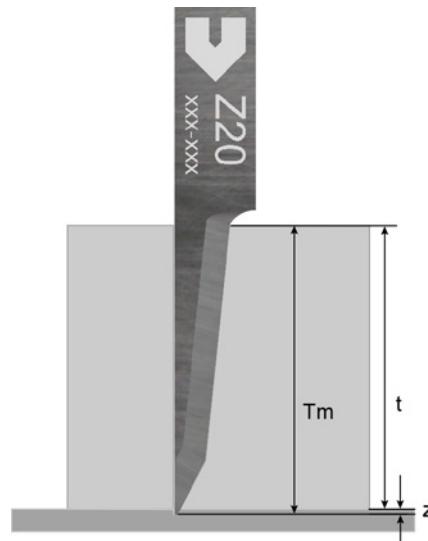

Oscillating blade – pointed

## 2.1.4 Maximum cutting depth

There is a specified maximum cutting depth for each blade, which is determined by the length of the cutting edge. The cutting depth which can be achieved depends greatly on the type of material. The cutting depth of some oscillating blades will be reduced when using the glide shoe. Please remember to factor in the set depth as well as the material thickness.

t Material thickness

z Set depth

Tm Cutting depth = material thickness t + set depth z

## 2.1.5 Overtcut x

The pre-cut:  $x_1$  is the distance from the centre of the axis of rotation to the first point where the cutting edge cuts the material surface in the direction of travel. The Post-cut:  $x_2$  is the measurement from the centre of the axis of rotation to the last point where the cutting edge cuts the material surface.

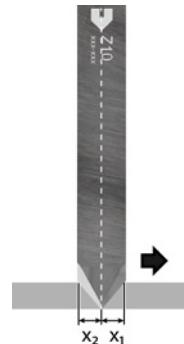

The cutting angle has the greatest influence on processing quality. A narrower cutting angle may enable faster cutting, but it also produces a greater overcut. A narrower cutting angle can be used for paths that include large curves and long straight sections.

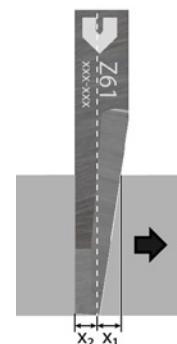

### Tip!

The overcut distorts the cutting contours. For cuts with a low margin of error, Zünd recommends choosing a blade with a smaller overcut. Overcut information can be found in the additional specifications for each blade.

### Drag blades

### Oscillating blade – flat

### Oscillating blade – pointed

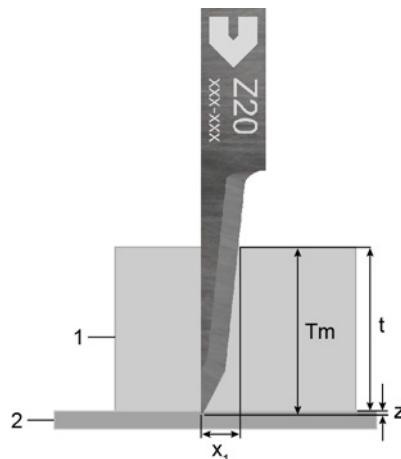

## 2.1.6 Calculating the overcut

Depending on the cutting depth, the blade geometry will produce a different level of overcut. This chapter explains how to calculate your overcut based on the blade you are using and the material you are cutting. The Z20 pointed oscillating blade and Z11 drag blade are used as examples here.

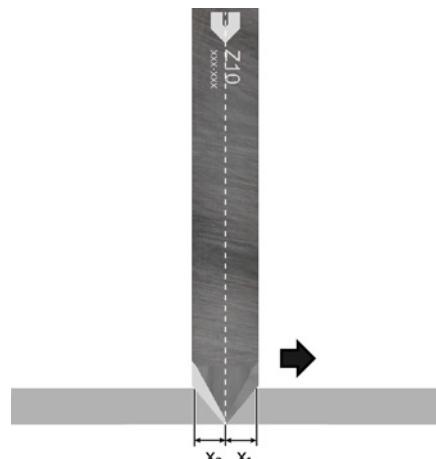

The cutting depth  $T_m$  is made up of the material thickness  $t$  and the set depth  $z$ . Insert these values into the formula as they are listed in the product description for each blade. The result will be the pre-cut:/post-cut: in mm.

**Example Z20**

- 1 Material
- 2 Cutting underlay
- $t$  Material thickness
- $z$  Set depth
- $T_m$  Cutting depth = material thickness  $t$  + set depth  $z$
- $x_1$  Pre-cut
- $x_2$  Post-cut

**Example Z11**

### Sample calculation Z20

**Formula**  $X = 1.2 + 0.11 \times T_m$

**Cutting depth**  $T_m = 10.2 \text{ mm}$

**Pre-cut:**  $X_1 = 2.322 \text{ mm}$

### Sample calculation Z11

**Formula**  $X_{1,2} = 0.58 \times T_m$

**Cutting depth**  $T_m = 5.2 \text{ mm}$

**Pre-cut:**  $X_1 = 3.016 \text{ mm}$

**Post-cut:**  $X_2 = 3.016 \text{ mm}$

## 2.1.7 Blade Types

Depending on which tool they are used in, a distinction is made between the following blade types:

- **Drag blades:** used in non-powered tools such as UCT, KCT, VCT, SCT, C2, insert sleeve 40)
- **Oscillating blades:** used in EOT/POT oscillating tools
- **Rotary blade:** decagonal (ten-sided) blades for DRT/PRT tools

### Drag blades

Drag knives are used in combination with non-powered tools (UCT, KCT, VCT, SCT, C2).

**Round-stock blade**  
(e.g. Z1)

**Flat-stock blade**  
(e.g. Z10)

**Mat-cutting blade**  
(e.g. Z34)

**V-cut blade**  
(e.g. Z70)

### Oscillating blades

The oscillating tool is mostly recommended for cutting thick and tough materials. The oscillating motion of the blade decreases the drag force exerted on the material in the direction of travel. However, to achieve this, the feed speed must be precisely adjusted to suit the selected oscillating blade and oscillation frequency. Choosing the right oscillating blade depends primarily on the contour to be cut:

- Zünd recommends flat blades for large radii, straight and large parts.
- Very sharp, pointed blades should only be used to cut small radii. The feed speed must be reduced to achieve a good quality cut.

**Flat blade (e.g. Z43)**

- High cutting speed
- Large radii, straight and/or large parts

**Pointed blade (e.g. Z20)**

- Low cutting speed
- Small radii and/or small parts

- Maximum cutting speed; cheap to purchase and maintain
- High cutting force
- Particularly suitable for foils, paper, thin folding carton, banners, etc.
- Most cost-effective cutting option, as the purchase price for the associated tools (UCT, KCT, VCT, SCT, C2) is considerably lower than those for powered tools.

**Rotary blade****Decagonal (ten-sided) blades**

- Very high cutting speed
- Suitable for large radii, straight and/or large parts
- Recommended for breathable materials such as textile, carbon fibre, glass fibre, etc.
- Very large overcut

### 2.3 Product description

#### Z1

**Item no.:** 3910105

##### Type

Round-stock drag blade

##### Properties

Blade for cutting any standard self-adhesive vinyls.

##### Recommended materials

- Self-adhesive vinyls
- Masking film
- Cardstock
- Pattern materials

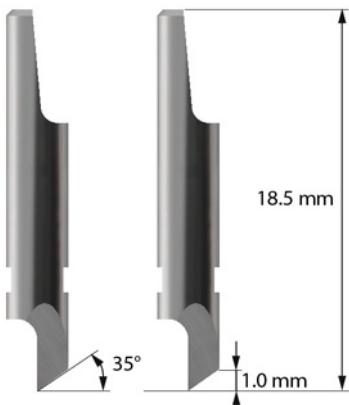

#### Technical information

Pre-cut: 1.43 x Tm

Post-cut: -

Max. cutting depth: 1.0 mm

Blade material: Carbide

#### Intended use

KCT,  
Insert sleeve 40  
for vinyl blades

C2, C2P

KCM-S

#### Z2

**Item no.:** 3910110

##### Type

Round-stock drag blade

#### Technical information

Pre-cut: 1.43 x Tm

Post-cut: -

Max. cutting depth: 1.0 mm

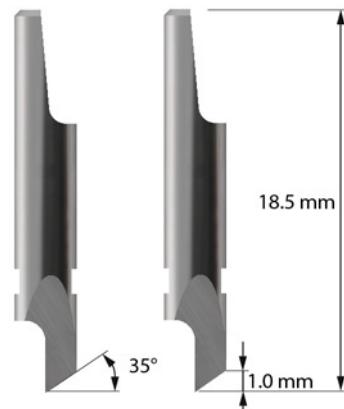

Blade material: Carbide

##### Properties

Blade for cutting any standard self-adhesive vinyls. Similar to the Z1, but exerts less drag force and has a shorter life expectancy.

##### Recommended materials

- Reflective vinyls
- Self-adhesive vinyls
- Masking film
- Cardstock
- Pattern materials

#### Intended use

KCT,

**Z10****Item no.:** 3910301**Type**

Flat-stock drag blade

**Properties**

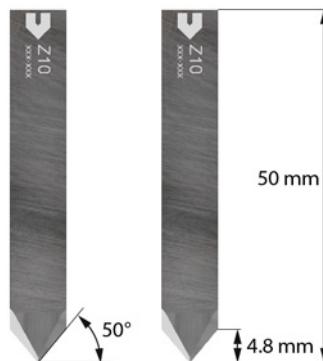

Stable and robust double-edged drag blade. Similar to Z11, but with a larger overcut and longer life expectancy.

**Recommended materials**

- Tarpaulin material
- PVC banners (frontlit/backlit)
- Polypropylene; PP
- Polyester fabric; coated textiles
- Polycarbonate; PC
- Folding carton; 100 - 1500 g
- Vinyl
- Hard foam core

**Z61**

Item no.: 5201343

**Type**

Oscillating blade – flat

**Properties**

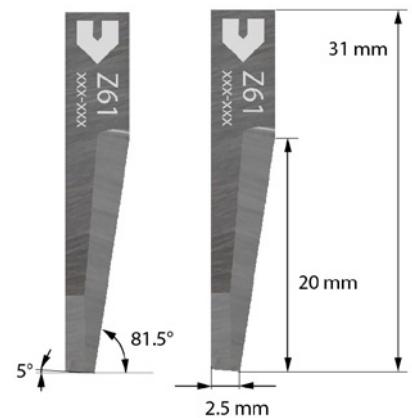

Very robust, heavy-duty oscillating blade.

**Recommended materials**

- Sandwich board
- Corrugated cardboard
- Corrugated plastic

**Technical information**

Pre-cut: 2.5 + 0.15 x Tm  
Post-cut: -  
Max. cutting depth: 20 mm  
Blade thickness: 1.5 mm  
Blade material: Carbide

**Intended use**

EOT-250

**Intended use**

**Z63**

Item no.: 5002637

**Type**

Oscillating blade – flat

**Properties**

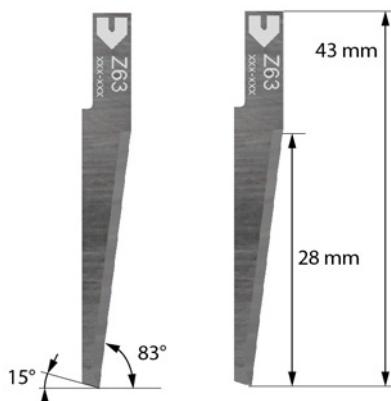

Oscillating blade with small pre-cut. Similar to Z62, but longer and therefore a little less stable.

**Recommended materials**

- Foam
- Insulating mat

**Technical information**

Pre-cut:  $0.8 + 0.12 \times T_m$   
 Post-cut: 1.20 mm  
 Max. cutting depth: 28 mm  
 Blade thickness: 0.63 mm

## 11 Cutting and routing underlays

### Cutting underlay PLP (anthracite)

Standard board for cutter models without material transport. Due to the max. raw material size of 1500 x 1000 mm, larger cutting areas must be covered with multiple elements.  
Thickness: 2.5 mm

### Cutting underlay S (anthracite)

Underlay from the same material as models with material transport (conveyor belt). The polyester non-woven material (PET) reinforced with textile fabric is available in one piece for all cutting area sizes.  
Thickness: 2.8 mm

### Cutting underlay ST (brown)

Thin cutting underlay, primarily used for cutting through in vinyl cutting solutions. Facilitates an optimized cutting edge and clean, defined baseline when using recorders.  
Max. available width 1800 mm.  
Thickness: 1.0 mm

### PU cutting underlay coated (red)

Cutting underlay with a thick PU layer for the cutting process using a wheel knife tool (WKT). Vacuum adhesion is not possible because it is airtight.  
PU layer: 2.0 mm.  
Total thickness: 5.1 mm

### Sealgrip routing underlay

Routing underlay with special adhesion conditions for material hold-down during the routing process.  
Material dimension 1000 x 1600 mm – also available as 1 x 30 m roll material.  
Thickness: 2.0 mm

### Sealgrip W routing underlay

Routing underlay with special adhesion conditions for material hold-down during the routing process.  
Material width 1530 mm  
Thickness: 2.0 mm
