

Zünd Cut Server

With an additional license, Zünd Cut Server can be installed on a central PC server which enables data exchange within the network at any time and location independent for increased process security.

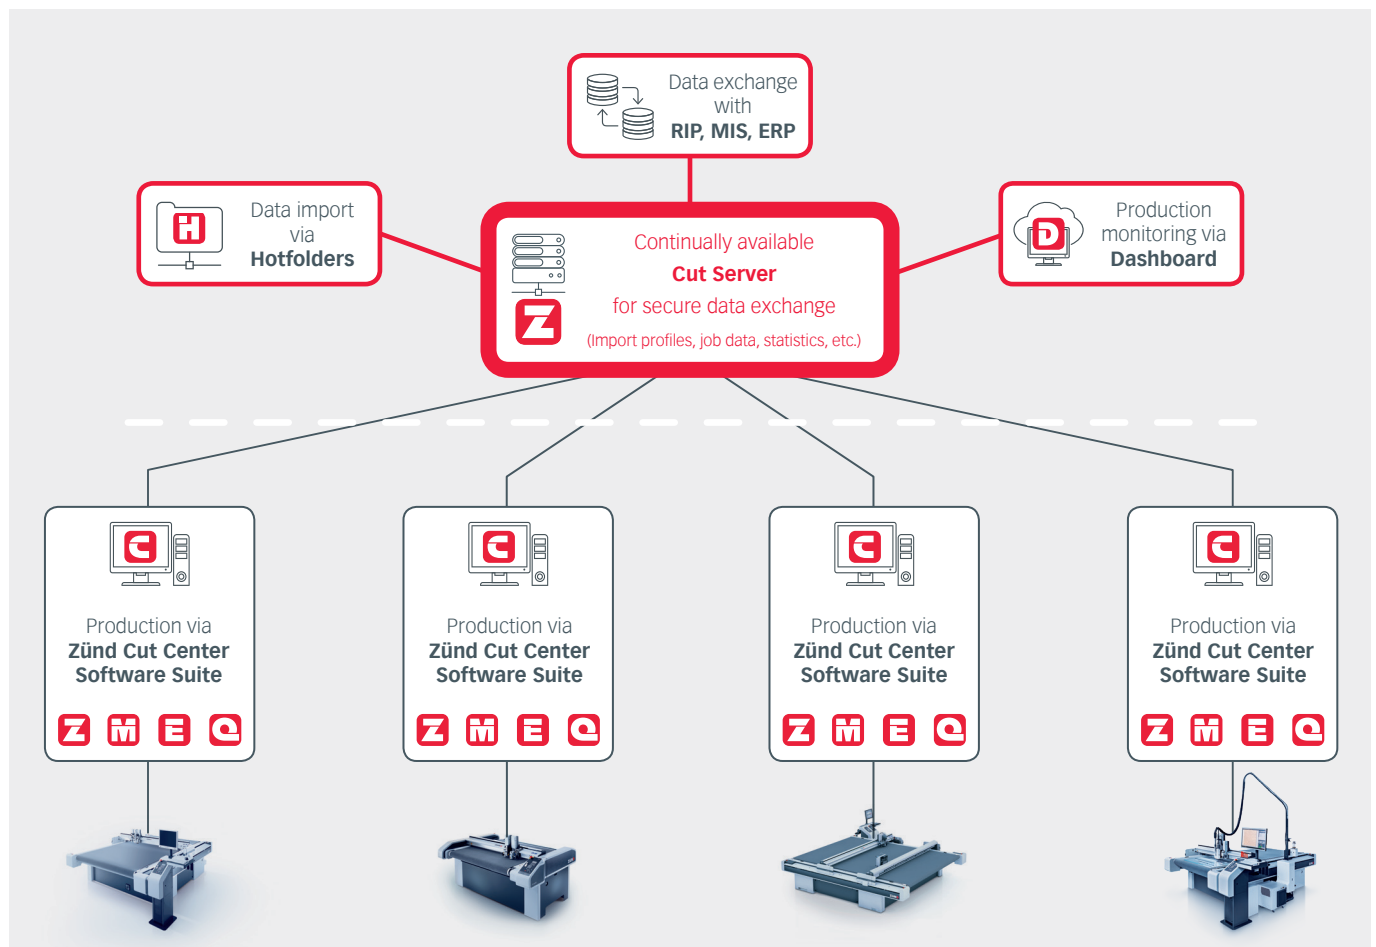

Cut Server is the centerpiece of the Zünd Cut Center Software suite and creates the interface between individual program components. With an additional license, Zünd Cut Server can be installed on a central PC server located away from the production area, e.g. in an external server room with optimal conditions

for climate control, fire safety, and restricted access.

A central Cut Server enables the secure exchange of data within the network – even if it includes several cutting systems. With pre-determined universal import profiles, all data import is centralized in one location – regard-

less of which cutter is ultimately used for processing the job.

This network structure ensures a high degree of process security since the central Cut Server is available around the clock and unaffected by potential failures of individual workstations in the production department.

Details

Installation possible on physical or virtual server.
License file must be stored on a physical computer.

Requires ZCC Version 3.1.0 or newer.

Benefits at a glance

Continually available, central Cut Server permits secure data exchange around the clock, location independent.

Installation on a PC server or virtual machine offers high process security.

Support of the following functions (incl. centralized for multiple cutters):

- Cut Manager: enables global settings, hot-folder setup, database management for materials and job statistics.
- Cut Queue: production management, job sorting and filtering
- Dashboard: production monitoring of all cutting systems
